Either one of the total capacity data [0, 64k, 128k, 192k, 256k, 320k, 384k] bytes can be selected by GS ( E . The default value is 384 KB .
[Description] - Defines the specified NV bit image.

- n specifies the number of the NV bit image you are defining.
$-\mathrm{xL}, \mathrm{xH}$ specify the number of dots in the horizontal direction for the NV bit image with [ $(x L+x H \times 256) \times 8$ ].
$-\mathrm{yL}, \mathrm{yH}$ specify the number of dots in the vertical direction for the NV bit image with $[(y L+y H \times 256) \times 8]$.
- If this command is processed when the NV graphics is defined with GS ( L or GS 8 L , delete all NV graphics data, then define the bit image data with this command.
[Notes] - Frequent write command executions by this command may damage to the NV memory. Therefore, it is recommended to write to the NV memory 10 times or less a day.
- During processing of this command, the printer is BUSY while writing the data to the NV bit image memory and stops receiving data. Therefore, it is prohibited to transmit data, including real-time commands, during the execution of this command.

| 12 | GS ( E pL pH fn a | 12 | Transmits the communication <br> conditions for the serial interface. |

- pL, pH specifies ( $\mathrm{pL}+\mathrm{pH} \times 256$ ) as the number of bytes after pH ( fn and [parameter]).
- The user setting mode is a special mode to change the values in the NV user memory with this command.
- In Function 2, the printer performs software reset. Therefore, the printer clears the receive and print buffers, and resets all settings (user-defined characters, macros, and the character style) to the mode in effect at power on.
[Notes] - Frequent write commands by this command, may damage the NV memory. Therefore, it is recommended to write to NV memory no more than 10 times a day.
- While processing this command, the printer is BUSY while writing data to the user NV memory and stops receiving data. Therefore it is prohibited to transmit data including the real-time commands during the execution of this command.

- ESC @ is executed
- The printer is reset or the power is turned off
- When processing Function 081 or 082, the setting values of Functions 065 to 070 are used. If the printable area is not large enough, the symbol may not be printed.

## For QR Code symbol (when cn=49)

- The symbol data specified by Function $180 \mathrm{~d} 1 \ldots \mathrm{dk}$ is stored in the printer and is printed by the specification of Function 181. The symbol data in the save area is reserved until the following processing is performed :
- Function 080 or 181 is executed
- ESC @ is executed
- The printer is reset or the power is turned off
- When processing Function 181 or 182, the setting values of Functions 165, 167, 169 are used. If the printable area is not enough, the symbol may not be printed.

* The recognition rate of the symbol is affected by the height of the symbol, module height, module width ratio, and the performance of the reader.
* It is recommended that the module height and module width be set so that the height of the symbol is bigger than 5 mm ( 0.2 inch).
* It is recommended that the module height be set three to five times the width of the module.
* The module height is specified by Function 068. The width of a module is specified by Function 067. The number of the rows is specified by Function 066.
* The size of the symbol is confirmed by the transmission data of Function 082.

* Numerical mode
* Alphanumeric mode
* Kanji mode
* 8-Bit byte mode
- The following data are added automatically by the encode processing.
- Position Detection Patterns
- Separators for Position Detection Patterns
- Timing Patterns

- Version Information
- Error Correction code words (employs the Reed-Solomon Error Detection and Correction algorithm)
- Pad codeword

## SRP-350plusA\&C

[Description] - Prints a raster bit image in m mode.

- $m$ specifies the bit image mode.

| m | Mode | Vertical dot density | Horizontal dot density |
| :---: | :---: | :---: | :---: |
| 0,48 | Normal | 180 dpi | 180 dpi |
| 1,49 | Double-width | 180 dpi | 90 dpi |
| 2,50 | Double-height | 90 dpi | 180 dpi |
| 3, 51 | Quadruple | 90 dpi | 90 dpi |

$-\mathrm{xL}, \mathrm{xH}$ specifies ( $\mathrm{xL}+\mathrm{xH} \times 256$ ) byte(s) in the horizontal direction for the bit image.
$-\mathrm{yL}, \mathrm{yH}$ specifies ( $\mathrm{yL}+\mathrm{yH} \times 256$ ) dot(s) in the vertical direction for the bit image.

- $d$ specifies the definition data of the bit image data.
